ABSTRACT

The importance of food for human survival has been discussed in several medical conferences. Consumers now have more opportunities to learn about nutrition patterns, understand their daily eating habits, and maintain a balanced diet owing to modern dietary evaluation and nutrition analysis tools. Due to the ignorance of healthy food habits, obesity rates are increasing at an alarming speed, and this is reflective of the risks to people's health. People need to control their daily calorie intake by eating healthier foods, which is the most basic method to avoid obesity. However, although food packaging comes with nutrition (and calorie) labels, it's still not very convenient for people to refer to App-based nutrient dashboard systems which can analyze real-time images of a meal and analyze it for nutritional content which can be very handy and improves the dietary habits, and therefore, helps in maintaining a healthy lifestyle. This project aims at building application that automatically estimates food attributes such as ingredients and nutritional value by classifying the input image of food. This method employs deep learning model (CNN) for accurate food identification and Food API's to give the nutritional value of the identified food.

1. INTRODUCTION

1.1 PROJECT OVERVIEW

The style of life in the modern world is evolving daily, and with it, the requirements of the human body's composition, which includes a variety of consumables or prepared foods, are changing as well. Obesity, or being overweight, is one issue brought on by an abundance of food in our daily life. The body's excessive calorie consumption is the root cause of this issue. In today's world, obesity is becoming a major problem. Therefore, we need a system that can influence people's eating habits and give them guidance leading to healthy lifestyle maintenance. If a system alerts users to the nutritional information of a food item and categorises it as healthy or unhealthy as well as the nutrition content to the user, they can establish their daily intake of calories from their diet. First, we must determine the type of food, and then, after predicting the type of food (fruit or vegetable), our system must determine the type of that image (if the image is in the category of food or vegetable). A combination of deep learning techniques is used to recognise the image and determine the category based on it. Our approach incorporates a wide range of segmentation and picture features.

1.2 PURPOSE

The type of food must be determined first, and then our system must determine the type of that image after predicting the type of food (fruit or vegetable) (if the image is in the category of food or vegetable). The image is recognised, and a category is derived from it using a combination of deep learning algorithms. Our method includes a variety of segmentation and image properties.

Due to the ignorance of healthy food habits, obesity rates are increasing at an alarming speed, and this is reflective of the risks to people's health. People need to control their daily calorie intake by eating healthier foods, which is the most basic method to avoid obesity. However, although food packaging comes with nutrition (and calorie) labels, it's still not very convenient for people to refer to App-based nutrient dashboard systems which can analyze real-time images of a meal and analyze it for nutritional content which can be very handy and improves the dietary habits, and therefore, helps in maintaining a healthy lifestyle.

2. LITERATURE REVIEW

2.1 EXISTING PROBLEM

Decreased appetite:

Lack of appetite, or decreased hunger, is one of the most troublesome nutrition problems you can experience. Although it's a common problem, its cause is often unknown. Appetite-stimulating medicines are available. Ask your provider if such medicines would help you.

Snack guidelines:

Wasting your energy eating foods that provide little or no nutritional value (such as potato chips, candy bars, colas and other snack foods).
A nutritional problem or deficiency refers to a condition when an individual's body experiences a shortage of essential nutrients or some specific nutrient. Such problems can give rise to several health issues such as anaemia

2.3 PROBLEM STATEMENT DEFINITION

In existing system, the way food data is analysed is evolving as a result of recent developments in computer vision and machine learning. Food-related photos, however, are frequently challenging to recognise and slow to detect due to the high quantity of food items and the ineffectiveness of the detection method. A diet plan is also fully manual to obtain. People may occasionally have to wait for many hours before learning about the suggested diet plan after contacting their dietician. For users, this makes getting their diet plan challenging. From the perspective of the customer, this is ineffective.

3. IDEATION & PROPOSED SOLUTION

3.1 EMPATHY MAP CANVAS

3.2 IDEATION & BRAINSTORMING

Brainstorming

Brainstorm & idea prioritization

Brainstorming provides a free and open environment that encourages everyone within a team to participate in the creative thinking process that leads to problem solving. Prioritizing volume over value, out-of-the-box ideas are welcome and built upon, and all participants are encouraged to collaborate, helping each other develop a rich amount of creative solutions.

[Share template feedback](#)

1

Define your problem statement

What problem are you trying to solve? Frame your problem as a How Might We statement. This will be the focus of your brainstorm.

5 minutes

How might we find and grow information about food?

2

Brainstorm

Write down any ideas that come to mind that address your problem statement.

10 minutes

Person 1

Use AI

Share all food data to everyone

Person 2

Use 3D body AR/VR

Person 3

Use Google Lens

Person 3

Bring info from users

3

Prioritize

Your team should all be on the same page about what's important moving forward. Place your ideas on this grid to determine which ideas are important and which are feasible.

20 minutes

Importance

Rank ideas based on how important they are to solving the problem. Rank ideas based on how important they are to solving the problem.

Feasibility

Rank ideas based on how feasible they are to implement. Rank ideas based on how feasible they are to implement.

3.3 PROPOSED SOLUTION

Sufficient nutrition and energy consumption, which can only be obtained through proper eating habits, are essential for maintaining a healthy existence. In addition to maintaining a good standard of living, a healthy diet helps people prevent chronic conditions including diabetes, high blood pressure, mental illness, asthma, and others. Obesity is one of the conditions brought on by over eating that is most common. When a person is obese, excess body fat accumulates to the point where it endangers their health. For the suggested system to recognise and locate food items from the input images, develop an automated nutrition analysis system. By locating possible locations and classifying them with deep neural networks, develop a three-step procedure specifically for detecting various foods in photographs. In the first stage, the automated system generates numerous regions of proposals using the provided photos. Then, it collects each region of thoughts by locating them in the original pictures, putting them on feature maps, and classifying them according to different food groups. Finally, by analysing the nutritional elements in the images, determine the food's calories, fat, carbs, and protein contents as well as its ingredients to generate a dietary evaluation report. The system's effectiveness and accuracy will also be increased by expanding the dataset to cover a larger variety of food types.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Users not knowing which food contains which ingredients or nutrition
2.	Idea	Using AI model for predicting the food name, ingredients and nutrition values
3.	Uniqueness	Usage of AI APIs
4.	Customer Satisfaction	Accurate nutrition information
5.	Business Model (Revenue Model)	Open source
6.	Scalability of the Solution	Using kubernetes for scalability

3.4 PROBLEM SOLUTION FIT

There is no organised way to quickly collect dietary data. Waiting times for diet appointments might be hours long. Calculate the calories, fat, carbohydrates, and protein content after examining the nutritional components in the images to produce a report on the dietary quality. The system's effectiveness and accuracy will be increased by broadening the information to include a wider variety of food types.

Problem Solution Fit

<p>1. CUSTOMER SEGMENT(S) CS</p> <p>Our customer is one who are Trying to live in a healthy life and who want to analyze the health conditions by using the app which helps to recognize the food items and need the list of diet plans present in it.</p> <p><i>Define CS, fit into CC</i></p>	<p>6. CUSTOMER CC</p> <p>Accurate data Customer Satisfaction Prior Planning process</p>	<p>5. AVAILABLE SOLUTIONS AS</p> <p>The available solution already present is the in-built items present which is been already given and present and stored by the other persons. For example, there is already the items and the quantity present in it and now as a different thing we are making an alarm to notify and to store this in cloud.</p> <p><i>Explore AS, differentiate</i></p>
<p>2. JOBS-TO-BE-DONE / PROBLEMS J&P</p> <p>The users can plan their diet to do their daily healthy plan. The app analyses your diet chart and help you to remind your progress.</p> <p><i>Focus on J&P, fit into BE, understand RC</i></p>	<p>9. PROBLEM ROOT CAUSE RC</p> <p>Nowadays new dietary assessment and nutrition analysis tools enable more opportunities to help people understand their daily eating habits, exploiting nutrition patterns and maintain a healthy diet.</p>	<p>6.BEHAVIOUR BE</p> <p>The main aim of the project is to building a model which gives best nutritional food and to know the quantity and value basis plan.</p> <p><i>Focus on J&P, fit into BE, understand RC</i></p>
<p>3. TRIGGERS TR</p> <p>Some people are very fitness conscious and they become healthy without any diseases and that tempts the others people to make them also to be healthy and fit.</p> <p>4.EMOTIONS:BEFORE/AFTER EM</p> <p>Emotions After: They don't have the fitness wellness in them and then they don't live a healthy life and eat more junk foods.</p> <p>Emotions After: They analyze the food which they are eating and make healthy life.</p>	<p>10. YOUR SOLUTION SL</p> <p>Aims to develop an application on mobile devices that is able to record the daily sleeping, exercise and nutrition information, analyze the collected information in order to provide a notification or an alarm, and present the analyzed results in a simple and easy to understand format. The proposed application can collect data from other applications and from the users. A set of simple data analysis methods is performed on the collected data in order to provide personal health advice based on the user's predefined preferences.</p>	<p>8.CHANNELS OF BEHAVIOUR CH</p> <ul style="list-style-type: none"> ➤ Model Building ➤ Import the model building Libraries ➤ Initializing the model ➤ Adding Input Layer ➤ Adding Hidden Layer ➤ Adding Output Layer ➤ Configure the Learning Process ➤ Training and testing the model ➤ Save the Model

4. REQUIREMENT ANALYSIS

4.1 FUNCTIONAL REQUIREMENT

Upload Image

In this module, the nutrition datasets should be uploaded as CSV files. Additionally, the information is kept in a database for later use. The dataset includes information on the calories, protein, fat, and food ingredient values of fruits and vegetables. These numbers are preserved as integer values and acquired from the Kaggle website.

Filtering Noise

Ability to determine the nutritional content of diverse fruits and vegetables is made possible by the use of filter techniques that reduce noise in photos. The filter's goal is to get rid of noise, which makes photographs look bad. Statistics back up this statement. A filter's typical frequency response is constructed. Filtering is a nonlinear technique widely used in image processing to get rid of "salt and pepper" noise. When edge preservation and noise reduction are top concerns, a median filter is preferable to convolution. Practice photo binarization in a similar way. In the pre-processing stage of document analysis, document picture binarization is used to separate the text in the foreground from the backdrop of the document. The succeeding document image processing tasks require a quick and precise binarization approach.

Classification

Classification is the process of dividing data into various categories. The method starts by determining the class of the given data points. Classification is achievable for both structured and unstructured data. The terms target, label, and classes are occasionally used to describe the classes. The user-uploaded food image will be compared to the food items in the system database for the features obtained in the feature extraction stage in the classification process. The specific food item will be recognised once the ideal match is discovered based on the qualities matched. The detected food item's name with ingredients will be displayed over the food. Here, a convolution neural network approach is employed to classify data.

Nutrition Detection

The food nutrition API receives the image after the model has identified the food category or food type and extracts the food's nutritional data before sending it to the system. The system contrasts the nutritional information with the suggested dietary allowances. If the amount of a specific nutrient, let's say calories, exceeds the recommended dietary allowance, the user will receive a warning message to reduce nutrition intake. In that case, the user will see the food's nutritional value.

4.2 NON-FUNCTIONAL-REQUIREMENTS

Usability

The system shall allow the users to access the system with pc using web application. The system uses a web application as an interface. The system is user friendly which makes the system easy

Availability

The system is available 100% for the user and is used 24 hrs a day and 365 days a year. The system shall be operational 24 hours a day and 7 days a week.

Scalability

Scalability is the measure of a system's ability to increase or decrease in performance and cost in response to changes in application and system processing demands.

Security

A security requirement is a statement of needed security functionality that ensures one of many different security properties of software is being satisfied.

Performance

The information is refreshed depending upon whether some updates have occurred or not in the application. The system shall respond to the member in not less than two seconds from the time of the request submittal. The system shall be allowed to take more time when doing large processing jobs. Responses to view information shall take no longer than 5 seconds to appear on the screen.

Reliability

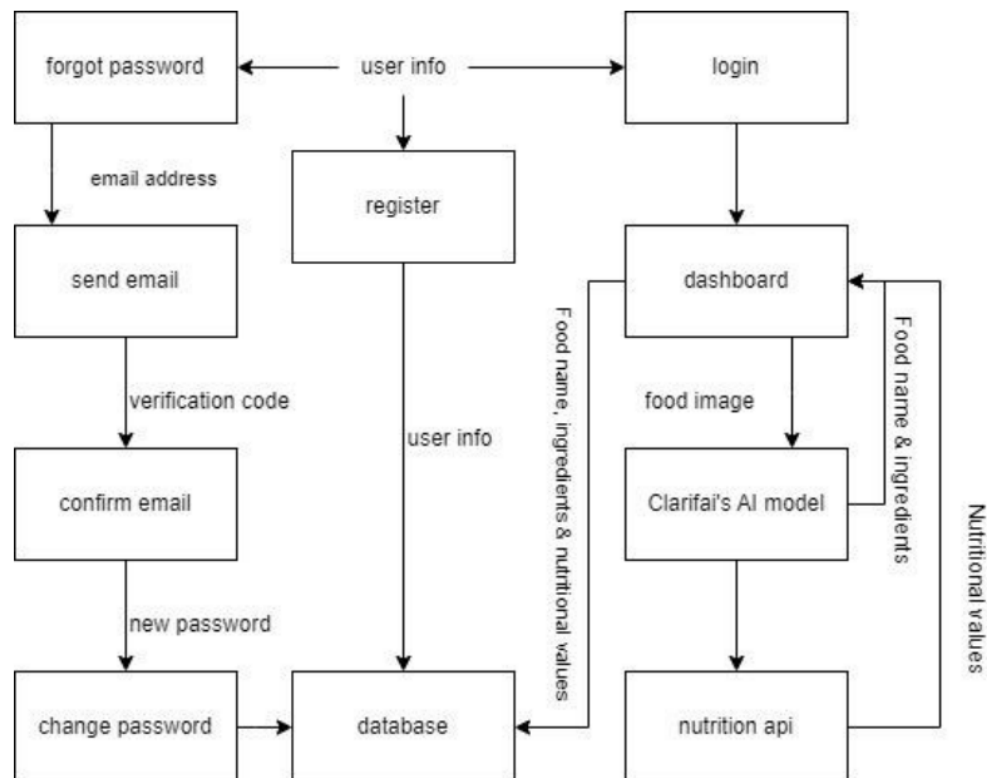

The system has to be 100% reliable due to the importance of data and the damages that can be caused by incorrect or incomplete data. The system will run 7 days a week. 24 hours a day.

5. PROJECT DESIGN

5.1 DATA FLOW DIAGRAMS

A two-dimensional diagram explains how data is processed and transferred in a system. The graphical depiction identifies each source of data and how it interacts with other data sources to reach a common output. Individuals seeking to draft a data flow diagram must identify external inputs and outputs, determine how the inputs and outputs relate to each other, and explain with graphics how these connections relate and what they result in. This type of diagram helps business development and design teams visualize how data is processed and identify or improve certain aspects.

Data Flow Diagram:

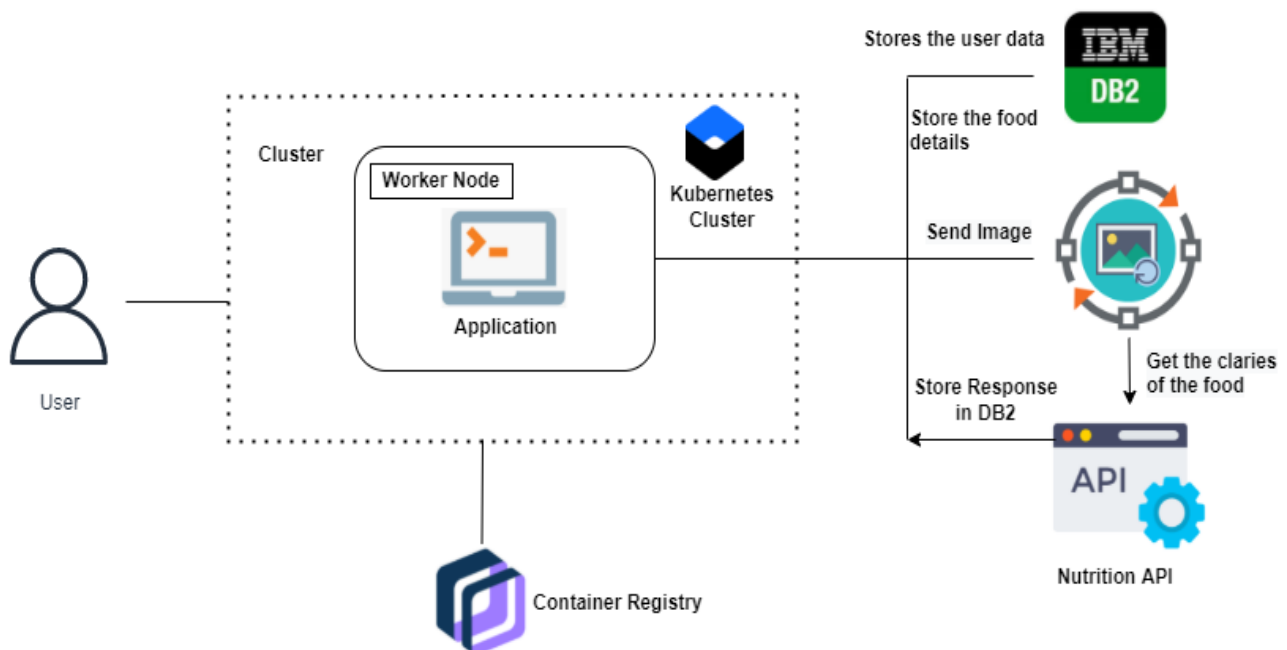

5.2 SOLUTION & TECHNICAL ARCHITECTURE

A system architecture or systems architecture is the conceptual model that defines the structure, behavior, and more views of a system. An architecture description is a formal description and representation of a system, organized in a way that supports reasoning about the structures and behaviors of the system.

Technical Architecture:

System architecture can comprise system components, the externally visible properties of those components, the relationships (e.g. the behavior) between them. It can provide a plan from which products can be procured, and systems developed, that will work together to implement the overall system. There have been efforts to formalize languages to describe system architecture, collectively these are called architecture description languages (ADLs).

5.3 USER STORIES

As a User, I can register the application by entering of user's name, email id and password.

As a User. I can login the application by entering the user name and password.

As a User, If I forgot my password, I can change my password.

As a User, I can upload the food image to the application.

As a User, I can analyse and gather a knowledge about the ingredients values and nutritional values of the uploaded food image.

6. PROJECT PLANNING & SCHEDULING

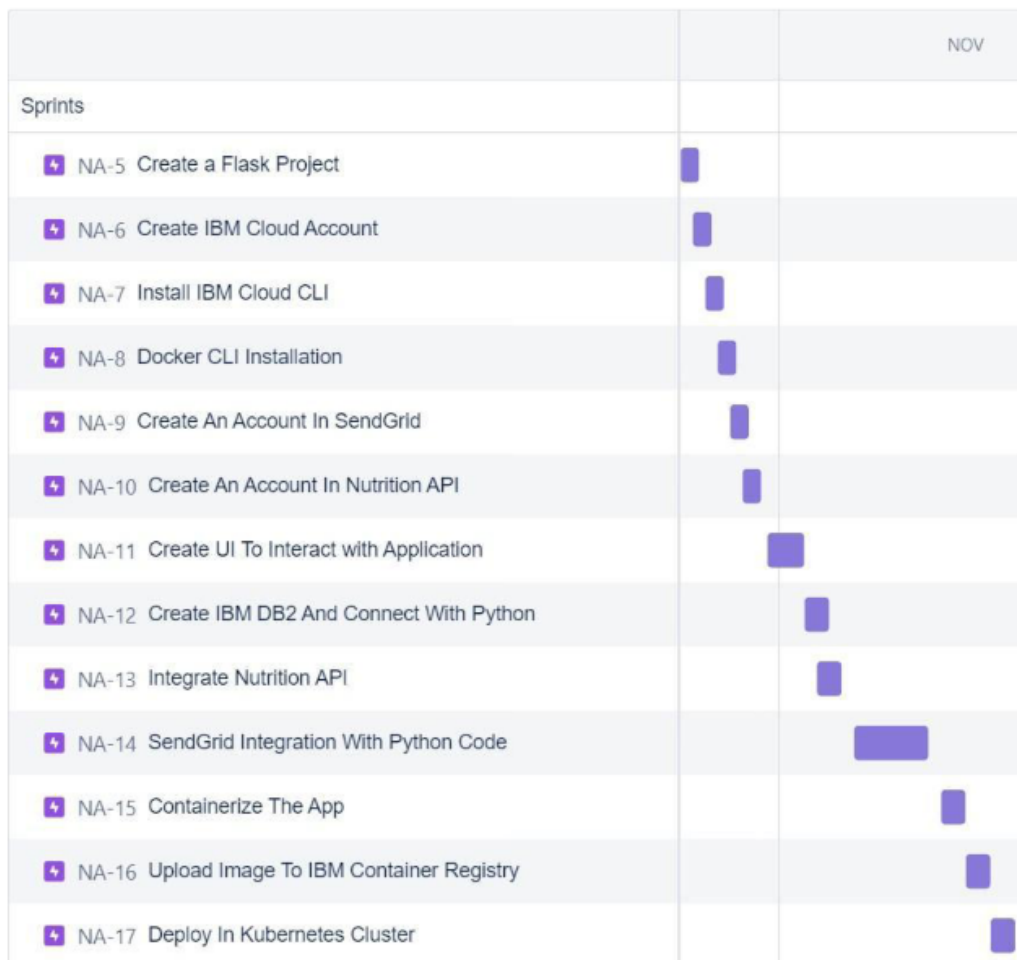

6.1 SPRINT PLANNING & ESTIMATION

Sprint	Functional Requirement (Epic)	User Story Number	User Story / Task	Story Points	Priority
Sprint-1	Registration	USN-1	As a user, I can register for the application by entering my email, password, and confirming my password and will receive confirmation email once I have registered for the application	2	High
Sprint-1	Login	USN-2	As a user, I can log into the application by entering email & password	2	High
Sprint-2	Forgot Password	USN-3	As a user I can change password if I forgot my password	1	Low
Sprint-2	Upload image	USN-4	As a user after login I can upload food images in dashboard	2	High
Sprint-3	Food recognition	USN-5	I get food name recognized by AI model	3	High
Sprint-3	Nutrition API	USN-6	I get nutrition details from APIs	2	High

6.2 SPRINT DELIVERY SCHEDULE

Sprint	Total Story Points	Duration	Sprint Start Date	Sprint End Date (Planned)	Story Points Completed (as on Planned End Date)	Sprint Release Date (Actual)
Sprint-1	20	6 Days	24 Oct 2022	29 Oct 2022	20	01 Nov 2022
Sprint-2	20	6 Days	31 Oct 2022	05 Nov 2022	20	05 Nov 2022
Sprint-3	20	6 Days	07 Nov 2022	12 Nov 2022	20	11 Nov 2022

6.3 REPORTS FROM JIRA

7. CODING & SOLUTIONING

Workflow

- User can enter the web app by registration and login.
- User interacts with the Web App to Load an image.
- The image is passed to the server application, which uses Clarifai's AI-Driven Food Detection Model Service to analyze the image and Nutrition API to provide nutritional information about the food.
- Nutritional information of the analyzed image is returned to the app for display.

7.1 FEATURE 1

In Dashboard page, It having the food image upload section and food details section in it. This page displayed the User name on dashboard and also having logout button for logging off of the user. This page can having to upload the food image to web app. The food image can recognize by using **Clarifai's AI-Driven Food Detection Model** and food is analysed by Intregrated Nutrition Food API. The Ingredients values and Nutritional values of food is displayed on the dashboard page. User can upload more images for analyse of its nutritional values.

Python Code:

```
@app.route("/dashboard", methods=["GET", "POST"])
def dashboard():
    global request
    if flask.request.method == "POST" and session['LoggedIn']:
        if 'file' not in flask.request.files:
            flash('No file part')
            return redirect(flask.request.url)
        file = flask.request.files['file']
        if file.filename == "":
            flash('No image selected')
            return redirect(flask.request.url)
        if file and allowed_file(file.filename):
            filename = secure_filename(file.filename)
            file.save(os.path.join(app.config['UPLOAD_FOLDER'], filename))
            flash('Image successfully uploaded')

            with open(os.path.join(app.config['UPLOAD_FOLDER'], filename), "rb") as f:
                file_bytes = f.read()

            request = service_pb2.PostModelOutputsRequest(
                model_id="food-item-v1-recognition",
                user_app_id=resources_pb2.UserAppIDSet(app_id=YOUR_APPLICATION_ID),
```

```

inputs=[
    resources_pb2.Input(
        data=resources_pb2.Data(image=resources_pb2.Image(
            base64=file_bytes
        ))
    )
],
)
response = stub.PostModelOutputs(request, metadata=metadata)

if response.status.code != status_code_pb2.SUCCESS:
    print(response)
    raise Exception(f'Request failed, status code: {response.status}')

foodname = response.outputs[0].data.concepts[0].name

```

7. TESTING

8.1 TEST CASES

A test case has components that describe input, action and an expected response, in order to determine if a feature of an application is working correctly. A test case is a set of instructions on “HOW” to validate a particular test objective/target, which when followed will tell us if the expected behavior of the system is satisfied or not.

Characteristics of a good test case:

- Accurate: Exacts the purpose.
- Economical: No unnecessary steps or words.
- Traceable: Capable of being traced to requirements.
- Repeatable: Can be used to perform the test over and over.
- Reusable: Can be reused if necessary.

S.NO	Scenario	Input	Output
1	User Registration	User Name, Email id, Password, Confirmation Password	Registration success
2	User Login	Username, , Password	Login success
3	Forgot Password (If password is forgotten)	User email id, New password	New password is updated
4	Upload Food image	Food image	Uploaded food image in dashboard.
5	Analyse the food	Food image	Predicted ingredients values and nutritional values of given food image are shown in dashboard of user.

8.2 USER ACCEPTANCE TESTING

This sort of testing is carried out by users, clients, or other authorised bodies to identify the requirements and operational procedures of an application or piece of software. The most crucial stage of testing is acceptance testing since it determines whether or not the customer will accept the application or programme. It could entail the application's U.I., performance, usability, and usefulness. It is also referred to as end-user testing, operational acceptance testing, and user acceptance testing (UAT).

8. RESULTS

9.1 PERFORMANCE METRICS

9. ADVANTAGES & DISADVANTAGES

ADVANTAGE

- Provide the nutrition content and ingredients of Multifoods
- Helps for fitness people to maintain and know the proteins and calories of the food
- Gives accurate results in real-time application

DISADVANTAGE

- Hard to know the details of nutrition and calories of food
- Doesn't ask to provide the users health condition
- Required more time to know the Multifoods

10. CONCLUSION

This project study suggests a technique for an automated food nutrition detection system that can estimate the quantity of nutrients in food. As of now, the machine can classify the meal into one of the numerous categories provided in the dataset. The categorization made use of the popular food dataset. Using a deep learning approach, the food photographs were categorised into the proper categories. It may be possible to improve the classification process by removing noise from the dataset. The same study can be conducted using a larger dataset, more classes, and more images in each class because doing so improves accuracy by teaching the algorithm new features and reduces loss rates. The weights of the model can be stored and used to develop designs for calorie extraction, food categorization, and image classification.

11. FUTURE SCOPE

Using a deep learning approach, the research study's food images are categorised into the relevant groupings. The classification task might be improved in the future by removing noise from the dataset. The same study may be conducted using a larger dataset, more classes, and more images in each class because doing so improves accuracy by teaching the algorithm new characteristics and reduces loss rates. A web or mobile application that categorises images and also extracts the calories from the food that has been identified may be created using the model's weights, which can be saved and used later.
